

This photo is from the AAW Symposium in Charlotte (summer 2003). I am fairly sure from my notes that it is one style Bill Johnson was talking about. According to Bill, this is made of 1/2 inch stock and is for small (4 to 5 inch) vessels.

The tool below is the Bill Johnson tool with the Basham modification. Jack DeVos has also done some development on these tools.

Note the size of this one is about 8 in wide and 10 inches long made with 5/8 inch stock, the pad is a standard steno pad, also note that it is rotated about the vertical axis in this photo. The cutter should be on the right.
